

## REMOTE CONSOLE CABLES

The Remote Console Cable is used to connect the Console, AIU or HBC to either of the 'HD 15 way D-Type' interface connectors at the rear of the transceiver. The cable carries:

- Console comms
- PEI comms
- Console power
- Audio in and out

Different length cables provide a flexible installation solution so that the console can either be installed locally or remotely from the transceiver.

**Please Note:** The cable is not included with the transceiver or console (unless otherwise stated). This item should be ordered separately.

The following Remote Console Cables are available:

Sepura part number	Description
300-00067	Remote Console Cable 0.5m
300-00068	Remote Console Cable 2m
300-00664	Remote Console Cable 3m
300-00069	Remote Console Cable 5m
300-00665	Remote Console Cable 7m
300-00070	Remote Console Cable 10m
300-00666	Remote Console Cable 12m

In addition to the cables listed above, we provide a Console Interface Box (300-00221). This unit allows the installer to connect two remote console cables together.

Please note that this method of connecting cables is not recommended for use in electrically noisy environments. Ideally, a single cable should always be used to minimise the risk of any external electrical interference being pick-up through the cable connections.

The following table shows the various approved combinations of radios and consoles.

Product combination\Cable length	Cables up to 12m	Cables up to 30m
